

ABSTRACT OF THE DISCLOSURE

There is provided an image display system that can display images recorded by a plurality of image recording apparatuses in such a manner that the images are associated with each other. The image display system is comprised of a TV apparatus that captures and reproduces images recorded by the plurality of image recording apparatuses and additional information added thereto and then displays each of the reproduced images. The TV apparatus detects the presence or absence of relevancy between the images recorded by the plurality of image recording apparatuses based on the additional information captured and reproduced from the plurality of image recording apparatuses, and then displays, on a display, a related image display screen that allows a viewer to recognize the detected related images.
